SECȚIUNE / SECTION B - B'
Scara / Scale 1:20

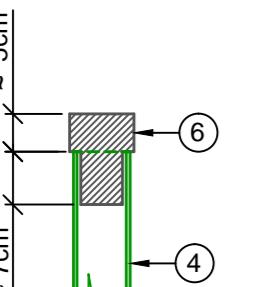

Tevi metalice de explorare cu diametrul minim :
Dmin = 52mm pentru tevile imbinate prin infilatire.
Dmin = 60-65mm pentru tevile imbinante prin sudură.
Exploration metal pipes with minimum diameter:
Dmin = 52mm for pipes joined by screwing.
Dmin = 60-65mm for pipes joined by welding.

LEGENDA:

1. Armăturile lungi ale carcasei de armătură.
2. Inele de rigidizare pe care se sudează barele lungi.
3. Fretă.
4. Tevi metalice \varnothing int = 52...65mm, pentru controlul nedistructiv al betonului.
5. Etrier în "V" sudat de țeava metalică și de inelul de rigidizare, din oțel beton OB 37 \varnothing 8mm, L min = 0,50 m/piece.
6. Dop etanș.

DESIGNATION:

1. Long fittings of the reinforcement carcass.
2. Stiffening rings on which the long bars are welded.
3. Hoop
4. Metal pipes int=52...65mm, for the non-destructive control of concrete
5. "V" shaped stirrup welded in the steel pipe and in the stiffening ring, made of concrete steel OB 37 diam= 8mm, L min = 0,50 m/piece.
6. Insulated stopper end.

NOTA:

1. Prezenta planșă cuprinde detaliiile de montare a țevilor de explorare pentru efectuarea controlului nedistructiv al betonului turnat în coloane (piloți) de beton.
2. Metoda se bazează pe glisarea palpatorilor emițător și receptor de ultrasunete în lungul unor țevi de explorare umplute cu apă și pe măsurarea vitezei de propagare a impulsurilor ultrasonice prin beton, între emițător și receptor. Viteza de propagare astfel măsurată este transformată ulterior în rezistență a betonului la compresiune, ținând seama de compoziția și maturitatea betonului precum și de rezultatele paralele nedistructive și distructive obținute prin încercarea corpurilor de probă.
3. Încercările nedistructive se efectuează conform Normativului C 26/85, completat prin Anexa la decizia ICCPDC nr. 19 / 17.04.1987 publicată în BC nr. 2/1987, de către unități specializate.
4. Diametrul minim interior al țevilor de explorare este 52mm pentru țevile imbinante prin infilatire și 60-65mm pentru țevile imbinante prin sudură.
5. Pipe sections are combined tightly, whether assembled by screwing or welding. The pipes are closed tightly with an insulated stopper end. At the top, the pipes are closed with another insulated stopper end that gives the possibility of posting the inspection.
6. Pipes exceed by 50cm the superior level of the solidarity beam to be easily identified. During reinforcement execution the warp pipes will be avoided.
7. Ensure the parallelism of the exploration pipes.
8. Exploration pipe will be mounted on the casing fittings on its making-off, on the inside of the carcass reinforcement rings.
9. It is recommended first to be mounted the exploration pipe and then mounting the longitudinal bars and hoop.
10. Fixing of casing pipe is made using stirrups in "V" position; welded in pipes and in the stiffening rings.

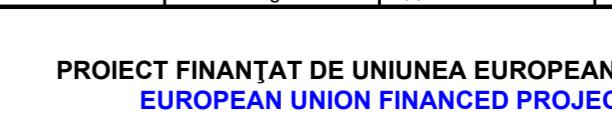

NOTE:

1. The present plate includes the pipe mounting details of exploration for concrete's un-destructive control poured in concrete columns (pilots).
2. The method is based on sliding detectors ultrasonic transmitter and receiver along the exploration of water-filled tube and measuring the propagation velocity of ultrasonic pulses through concrete, between the transmitter and receiver. Propagation velocity as measured is then converted into concrete compressive strength, given the composition and maturity of concrete and parallel results obtained by nondestructive and destructive testing of test bodies.
3. Non-destructive tests are carried out according to norm C 26/85, supplemented by Annex ICCPDC No decision. 19/17.04.1987 issued in BC no. 2/1987, by specialized units.
4. The minimum diameter of the pipe inner exploration is 52mm for pipes joined by screwing and 60-65mm for pipes joined by welding.
5. When purchasing pipes their inside it will be checked so that they won't contain protruding burrs from rolling more than 1mm or foreign entities.
6. Pipe sections are combined tightly, whether assembled by screwing or welding. The pipes are closed tightly with an insulated stopper end. At the top, the pipes are closed with another insulated stopper end that gives the possibility of posting the inspection.
7. Pipes exceed by 50cm the superior level of the solidarity beam to be easily identified. During reinforcement execution the warp pipes will be avoided.
8. Exploration pipe will be mounted on the casing fittings on its making-off, on the inside of the carcass reinforcement rings.
9. It is recommended first to be mounted the exploration pipe and then mounting the longitudinal bars and hoop.
10. Fixing of casing pipe is made using stirrups in "V" position; welded in pipes and in the stiffening rings.
